

IN THE CLAIMS:

Please amend the claims as follows. The claims are in the format as required by 35 C.F.R. § 1.121.

1. (Currently Amended) A data processing system-implemented method of tracking movement between network addresses comprising:
  - receiving a first frame identifier and a first network address at a tracking location at a first time, wherein the first frame identifier is associated with a first frame of a view provided by a location distinct from the tracking location and the first frame identifier is assigned in code executable to present the view;
  - finding a record including the first frame identifier, a second network address, and a second time, wherein the second time precedes the first time; and
  - generating an entry for a table that includes the first frame identifier, the first network address, the second network address, and a third time.
2. (Original) The method of claim 1, wherein the first time and the third time are substantially a same time.
3. (Original) The method of claim 1, further comprising sending a the view to a user before receiving the first frame and the first network address, wherein the view includes the first frame and a second frame having a second frame identifier.
4. (Original) The method of claim 3, further comprising generating a node diagram illustrating a sequence of network addresses that originated from the first frame but not the second frame.
5. (Original) The method of claim 1, further comprising, in response to receiving, sending a the view corresponding to the first network address to a computer that requested the first network address.
6. (Original) The method of claim 1, further comprising generating a statement of activity, wherein:
  - the first network address is significantly owned or controlled by a first party;
  - the second network address is significantly owned or controlled by a second party;

the first party is not significantly owned or controlled by the second party, and the second party is not significantly owned or controlled by the first party; and the statement indicates that a user activated the second network address from the first network address.

7. (Original) The method of claim 1, wherein:  
receiving further comprises receiving a user identifier; and  
the second time is closest in time to the first time for the user identifier and frame identifier.

8. (Currently Amended) A data processing system-implemented method of tracking movement between network addresses comprising:
  - displaying a first view provided by a location to a user, wherein the first view includes a first frame having a first frame identifier and a second frame having a second frame identifier, and the first frame identifier is assigned in code executable to present the first view;
  - receiving a first request for a first network address from the user, wherein the first request is generated by the user activating a first object within the first frame;
  - sending the first frame identifier and the first network address to a tracking location distinct from the location at a first time;
  - finding a record including the first frame identifier, a second network address, and a second time, wherein, for the first frame identifier, the second time precedes the first time; and
  - generating a first entry for a table that includes the first frame identifier, the first network address, the second network address, and a third time.
9. (Original) The method of claim 8, wherein the first time and the third time are substantially a same time.
10. (Original) The method of claim 8, further comprising displaying a second view corresponding to the first network address to the user.
11. (Original) The method of claim 8, wherein the second time is closest in time to the first time for the first frame identifier.
12. (Original) The method of claim 8, further comprising:
  - receiving a second request for a third network address from the user, wherein the second request is generated by the user activating a second object within the second frame;
  - sending the second frame identifier and the third network address at a fourth time;
  - finding a record having the second frame identifier, a fourth network address, and a fifth time, wherein, for the second frame identifier, the fifth time precedes and is closest in time to the fourth time; and

generating a second entry for the table that includes the second frame identifier, the third network address, the fourth network address, and a sixth time.

13. (Currently Amended) A data processing system readable medium having code embodied therein, the code including instructions executable by a data processing system, wherein the instructions are configured to cause the data processing system to perform a method of tracking movement between network addresses, the method comprising:

receiving a first frame identifier and a first network address at a tracking location at a first time, wherein the first frame identifier is associated with a first frame of a view provided by a location distinct from the tracking location and the first frame identifier is assigned in code executable to present the view;  
finding a record including the first frame identifier, a second network address, and a second time, wherein the second time precedes the first time; and  
generating an entry for a table that includes the first frame identifier, the first network address, the second network address, and a third time.

14. (Original) The data processing system readable medium of claim 13, wherein the first time and the third time are substantially a same time.

15. (Currently Amended) The data processing system readable medium of claim 13, wherein the method further comprises sending a the view to a user before receiving the first frame and the first network address, wherein the view includes the first frame and a second frame having a second frame identifier.

16. (Original) The data processing system readable medium of claim 15, wherein the method further comprises generating a node diagram illustrating a sequence of network addresses that originated from the first frame but not the second frame.

17. (Original) The data processing system readable medium of claim 13, wherein the method further comprises, in response to receiving, sending a view corresponding to the first network address to a computer that requested the first network address.

18. (Original) The data processing system readable medium of claim 13, wherein the method further comprises generating a statement of activity, wherein:  
the first network address is significantly owned or controlled by a first party;  
the second network address is significantly owned or controlled by a second party;

the first party is not significantly owned or controlled by the second party, and the second party is not significantly owned or controlled by the first party; and the statement indicates that a user activated the second network address from the first network address.

19. (Original) The data processing system readable medium of claim 13, wherein:  
receiving further comprises receiving a user identifier; and  
the second time is closest in time to the first time for the user identifier and frame identifier.

20. (Currently Amended) A data processing system readable medium having code embodied therein, the code including instructions executable by a data processing system, wherein the instructions are configured to cause the data processing system to perform a method of tracking movement between network addresses, the method comprising:

displaying a first view to a user, wherein the first view includes a first frame having a first frame identifier and a second frame having a second frame identifier, wherein the first frame identifier is associated with a first frame provided by a location distinct from the tracking location and the first frame identifier is assigned in code executable to present the first view;

receiving a first request for a first network address from the user, wherein the first request is generated by the user activating a first object within the first frame;

sending the first frame identifier and the first network address at a first time;

finding a record including the first frame identifier, a second network address, and a second time, wherein, for the first frame identifier, the second time precedes the first time; and

generating a first entry for a table that includes the first frame identifier, the first network address, the second network address, and a third time.

21. (Original) The data processing system readable medium of claim 20, wherein the first time and the third time are substantially a same time.

22. (Original) The data processing system readable medium of claim 20, further comprising displaying a second view corresponding to the first network address to the user.

23. (Original) The data processing system readable medium of claim 20, wherein the second time is closest in time to the first time for the first frame identifier.

24. (Original) The data processing system readable medium of claim 20, further comprising:  
receiving a second request for a third network address from the user, wherein the second request is generated by the user activating a second object within the second frame;  
sending the second frame identifier and the third network address at a fourth time;

finding a record having the second frame identifier, a fourth network address, and a fifth time, wherein, for the second frame identifier, the fifth time precedes and is closest in time to the fourth time; and  
generating a second entry for the table that includes the second frame identifier, the third network address, the fourth network address, and a sixth time.

25. (Currently Amended) A method of tracking the origin of a request for a network address, comprising:

receiving a first frame identifier and a requested network address at a tracking location at a first time, wherein the first frame identifier is associated with a first frame and the requested network address was requested from the first frame ~~and~~ the first frame was provided by a location distinct from the tracking location and the first frame identifier is assigned in code executable to present the view;  
finding a record including the first frame identifier, an originating network address and a second time, wherein the second time precedes the first time and the originating network address is associated with a page containing the first frame; and  
generating an entry for a table that includes the first frame identifier, the originating network address, the requested network address, and a third time.

26. (Currently Amended) A method of tracking the origin of a request for a network address, comprising:

receiving a first frame identifier and a requested network address at a tracking location at a first time, wherein the first frame identifier is associated with a first frame and the requested network address was requested from the first frame and wherein the first frame is associated with a view associated with a location remote from the tracking location and the first frame identifier is assigned in code executable to present the view;

finding a record including the first frame identifier, an originating network address and a second time, wherein the second time precedes the first time and the originating network address is associated with a page containing the first frame; and  
generating an entry for a table that includes the first frame identifier, the originating network address, the requested network address, and a third time.

27. (New) A method of tracking network addresses, comprising:

receiving a first frame identifier and a first network address at a tracking location at a first time, wherein the first frame identifier is associated with a first frame of a first view provided from a first location associated with a second network address, the first frame was selected at a second location, the first frame is associated with data at a third location associated with the first network address, and the first location, second location, third location and tracking location all distinct from one another;

finding a record including the first frame identifier, a fourth network address, and a second time, wherein the second time precedes the first time; and

generating an entry for a table that includes the first frame identifier, the first network address, the fourth network address, and a third time.
